Old solution (cont)

- There are 132 tornado scriptings at hou058ws/ts1/old_ama_home/arma/bin.
 - `rwxrwxrwx 1 input 68472013 cig2gamma_raw.cggv5`
 - `-rwxrwxrwx 1 input 164169932 cig2gath.cggv5`
 - `-rwxrwxrwx 1 input 195925001 cig_butterflyx2y.cggv5`
 - `-rwxrwxrwx 1 input 168223845 cig_combine_ave.cggv5`
 - `-rwxrwxrwx 1 input 169272974 cig_m2f.cggv5`
 - `-rwxrwxrwx 1 input 56157899 cigdipmath.cggv5`
 - `-rwxrwxrwx 1 input 59597449 cigpick_correct_by_gamma.cggv5`
 -
- Each one is almost a snapshot of tornado at the time the script was created
 - Outdated
 - Hard to find the original source

- Only one tornado script that supports these functions, instead of one tornado binary for one feature
 - Can't put all tornado features into scripting
 - Hard to count how many features in tornado
 - Start with a few frequently used, such as
 - Attribute->Update->Advanced Salt Insertion
 - Attribute->Update->Attribute Smooth
 - Utils->Volume Regrid
 - Movie->Image Output
 - Utils->Volume Math
- Wrap this tornado script into a standalone G2 module

- Task Tracker
 - Task [2786183](#) - shift horizon along normal vector (David Hren)
 - Task [2671433](#) - horizon generation based on gradients (Yi Huang)
 - ...
- Old solutions
 - Users write their own code to generate horizon/velocity model/seismic
 - Output into a format that can be loaded into tornado and QC results
 - Ask Tornado developers

Our proposal

- Open some tornado data structure for users
 - Users write their own algorithms to modify horizon, attribute or seismic data
 - View the results immediately in tornado
- Quick Demo (example script)

```
from Vision import *
from Horizon import *
hrz= vision.getCurrentHorizon()
(nx,ny)=getHrzSize(hrz)
for i in range(nx):
    for j in range(ny):
        if (i < nx/3):
            setHrzVal(hrz,i,j,2000.)
        elif (i<(2*nx/3):
            setHrzVal(hrz,i,j,4000.)
        else:
            setHrzVal(hrz,i,j,7000.)
```

Tornado Scripting Survey (1/2)

1. Select Preferred Workflow :
 - A. Run the same process on different input data (repetitive computing)
 - B. Run a series of processes on the same data (form a workflow)
2. Working environments
 - A. Run all the previous on the cluster instead of workstation (run a job deck)
 - B. Run on workstation (save images for PPT, plugin your own algorithm)
3. What algorithms are the most interesting to have for scripting
 - A. Those available in Tornado
 - B. Your own algorithms (e.g. Convert your data into a tornado data)
4. Set the priority of the following Tornado features (1 = top, 5 = lowest):
 - A. Attribute Smoothing (2)
 - B. Attribute Replace (3)
 - C. Volume Math (1)
 - D. Salt Insert (5)
 - E. Other ___ Horizon Manipulation (4) _____

5. Set priority for data types used for scripting (1 = top, 5 = lowest)
 - A. Horizons (2)
 - B. Seismic (stack) (3)
 - C. Attribute (1)
 - D. Well (5)
 - E. CigPick (4)
6. Scripting language (yes/no)
 - A. Do you know Python? No problem to learn it
 - B. Do you think Python is a good choice? yes
 - C. Do you consider other format (i.e.: matlab, text) as a must have? no
7. Some processes need a huge number of parameters and some parameters are dependent on others. Select the best way to set them ?
 - A. Use an external file row/column for the parameters (generated by Tornado GUI)
 - B. Set the parameters in the script
 - C. Use some tools like pie/ui and load in the script
 - D. Others ideas _____

- First release between 1-2 months
 - Send a list of tasks we are going to achieve in our first release
 - Demo the implemented functionalities
 - Set the priorities for next iteration
- Nice to have focus points (users)
 - Any user volunteers?
